

Week 1 — `week01_orientation.ows`

Companion notes for the Orange workflow. Read this beside the canvas, not instead of it. Book: chapter 1. Notebook twin: `notebooks/week01_foundations.ipynb`.

1. What this workflow is

The smallest workflow that still teaches something: **one source, three views**.

Dataset — `data/credit.csv`, 4,000 loan applications, 13 predictor columns plus the target `default` (yes/no). Money columns are in rupiah.

The idea being taught: widgets and channels. A widget is a small program with inputs and outputs. A link between two widgets is a *channel* carrying a typed object — here every link carries `Data` (an `Orange.data.Table`). Nothing is "run"; changing anything upstream pushes new data downstream immediately. That push model is the whole mental model of Orange, and everything in weeks 2–7 is just a longer chain of it.

Three widgets hang off one File on purpose: one source can feed many consumers, and each consumer answers a different question about the same table.

Widget	The question it answers
Data Table	<i>What do the rows actually look like?</i>
Feature Statistics	<i>What is each column, and how broken is it?</i>
Distributions	<i>What is the shape of one variable?</i>

2. What to do

1. **Open the file.** `orange-canvas week01_orientation.ows`. The File widget is pre-pointed at `data/credit.csv` — do not re-select it unless it shows an error.
2. **Double-click a link.** The channel dialog opens and shows `Data → Data`. Close it. You have now seen the thing that makes Orange a dataflow tool.
3. **Data Table.** How many rows and columns? Click a column header to sort.
4. **Feature Statistics.** Which column has the most missing values? Which columns, if any, are identifiers rather than features?

5. **Distributions.** Set the variable to `default`. What is the base rate of default? Write it down — week 7 will not make sense without it.

Versi mahasiswa. Pembahasan, hal yang perlu diperhatikan, dan jawaban setiap langkah disampaikan di kelas setelah praktikum.
